

Basic Computer Interview Questions and Answers Pdf

Question: 1

Define Clients and Servers?

- A **Client** is generally a single user PC or workstation that provides a highly user friendly interface to the end user. It runs client processes, which send service requests to the server.
- A **Server** is generally a relatively large computer that manages a shared resource and provides a set of shared user services to the clients. It runs the server process, which services client requests for use of the resource managed by the server. The network may be a single LAN or WAN or an internet of networks.
