Question: 5

What are objects?

An object is the most refined component in a universe. It maps to data or a derivation of data in the database.

Using objects, end users can build queries to generate reports. The name of an object suggests a concept drawn from the terminology of a business or discipline.

For the purposes of multidimensional analysis, objects are qualified as one of three types: dimension, detail, or measure.

We can't create object without class.
